

## Program 13: World Time Clock

### Description

In this program, we will create a world time clock that will give us the current time in a number of different countries. The program will display the current time and will allow the user to select the name of the required country from a list contained in a combo box. Once the user has done this, the adjusted time will be displayed for comparison. In order that the program is as flexible as possible, the user will also be able to select their city of origin.

A screen design is shown below:

Note that although Australian states are used as the locations, any locations can be used as long as you know how much time difference there is between any locations and GMT (Greenwich Mean Time).
